

THE PERSPECTIVE OF STRATEGIC LEARNING IN THE STUDY OF PEDAGOGICAL DISCIPLINES IN PUPILS AND STUDENTS' LIFE. APPLICATIONS TO THE DISCIPLINE "CLASSROOM MANAGEMENT"

Monica Iuliana Anca¹

Keywords: learning, strategic learning, learning strategies/techniques

Abstract. Strategic learning is the process of including specific tools and techniques to understand and learn new skills, to integrate new information into what is already known, to resume information and skills later, even in different situations or places. It involves building and supporting long-term learning techniques based on how a person learns best. Strategic learning is the type of learning in which the learner consciously participates in the learning process, while he is responsible for the learning process and controls his efforts to build, uses and promotes specific and particular cognitive strategies, techniques and tools, gaining independence and learning how to study independently and effectively. The importance of strategic learning has been demonstrated in school by showing that successful students use effective strategies to process information. When one learns strategically, one becomes aware of the learning process and mobilizes one's efforts to use some particular skills and strategies to obtain the best results.
